https://github.com/SETAPESU26/10_breakout , HELP ME COMPLETE THIS ALSO

Claude

Ran 3 commands

The repo has one bug plus three features to build. I'll do each task as its own git commit (as your lab requires), test it headlessly, then hand you everything.

Ran 9 commands, read 2 files, shared files

Here's everything you need. All four tasks are done and tested: the game is winnable every time, combos reach x8, and losing all 3 lives shows a game-over screen that restarts with R.

What I changed

- **Task 1 (the bug):** Each hit lowered `hits_remaining`, but nothing ever removed the brick. Now a brick is taken out of play when it reaches 0. I also made the ball bounce sideways when it clips a brick's side, instead of always flipping vertically.
- **Task 2:** You get 3 lives, shown as red dots in the top-right. Missing the ball costs a life and resets the ball. At 0 lives you get a "GAME OVER" banner, and clearing the level gives a "YOU WIN" banner. Press R to restart from either.
- **Task 3:** There are three brick types:
 - Normal bricks are red and break in 1 hit.
 - Strong bricks are blue and take 3 hits. Dots show the hits left, and the color fades as they get damaged.
 - Unbreakable bricks are metallic grey with rivets and never break.
- **Task 4:** Each brick you destroy without losing the ball raises the multiplier (x1, x2, up to x8). Points are 10 per normal brick or 30 per strong brick, times the multiplier. Missing the ball resets it to x1. The multiplier text turns gold, then orange, as the combo grows.
- **Follow-up fix:** My first layout put an unbreakable brick directly under a strong one, which made the level almost impossible to finish. I also stopped the ball from getting stuck bouncing straight up and down.

How to submit (separate commit per task)

Unzip the file somewhere *outside* your repo, such as Downloads. Then:

```
# 1. Put the ORIGINAL starter code in your Lab repo
git clone <your-lab-repo-url> && cd <your-lab-repo>
git clone https://github.com/SETAPESU26/10_breakout.git ../starter
mkdir Lab-4 && cp -r ../starter/breakout Lab-4/
cd Lab-4/breakout && pip install -r requirements.txt && python main.py
#    -> record the BEFORE video now (bricks never break)
cd ../../ && git add Lab-4 && git commit -m "Add Breakout starter code"

# 2. Apply each patch and commit it (repeat for 0001 to 0005)
git apply --directory=Lab-4 ~/Downloads/Lab-4/patches/0001-Task-1-*.patch
git add -A && git commit -m "Task 1: Fix ball-brick collision"
#    ...then 0002 (Task 2), 0003 (Task 3), 0004 (Task 4), 0005 (Task 3 follow-up)

# 3. Run it, record the AFTER video, add the videos, push
python Lab-4/breakout/main.py
git add Lab-4/*.mp4 && git commit -m "Add before/after videos" && git push
```

On Windows PowerShell, wildcards like 0001-* won't expand, so press Tab to autocomplete the full patch filename.

The remaining deliverables

- **Videos:** On Windows, Win+Alt+R records the game window (Xbox Game Bar). On Mac, use Cmd+Shift+5. For the "after" video, try to show a strong brick taking several hits, losing a life, and the multiplier going up.
- **Chat history:** This conversation counts. Use the Share button for a link, or print this page to PDF (Ctrl/Cmd+P). Your handout asks for a doc/pdf and the README asks for a link, so you could include both.
- **Don't** open a PR to SETAPESU26.

Since the lab is about prompting, it's worth reading through the patches before your evaluation so you can explain each change. Each one is short and commented.
